EWING CHRISTIAN COLLEGE, PRAYAGRAJ.

Introduction

This project aims to develop a medium for hiring blue collar workers. This platform will make it easy for potential employers to get in touch and hire the workers as per their requirement. This will make hiring process smooth.

Blue-collar jobs are typically classified as involving manual labor and compensation by an hourly wage. Some fields that fall into this category include construction, manufacturing, maintenance, and mining.

For decades, blue collar workers have been facing a major challenge: a lack of education and limited digital resources. This has resulted in them being unable to access job opportunities that require technical knowledge or even find the right kind of job for their skillset.

However, the good news is that technology can be used to solve this problem. This web app built using React and Firebase aims to provide blue collar workers with better job opportunities and makes it easy for employers to hire them easily.

The app will have an intuitive interface which will make it easy for employers to search through the database of blue-collar workers and find ones who are suitable for their particular job requirements. Furthermore, they will be able to contact the worker directly via the app itself, making it a convenient solution for both parties.

On the other hand, blue collar workers will have access to a wide range of jobs on offer through this application. They can filter their search based on location, type of work etc., allowing them to find jobs more suited for their needs easily. In addition, they can also view details about potential employers such as reviews from past employees and ratings from other sources before applying for any position.

Finally, the app will help bridge the gap between blue collar workers and potential employers by providing an easy-to-use platform where both parties can interact directly with each other without having any technical knowledge or expertise required from either side.

Why the topic is chosen?

Millions of workers are looking for jobs in the blue-collar field, but few websites provide this type of opportunity. The platform is designed to fill this gap by providing a platform for employers to post job openings and search for qualified blue collar workers. The website is easy to use and provides employers with all the information they need to find the perfect candidate.

Objective and Scope of the project

There are several problems faced by blue collar workers in India. These problems can include a lack of social security, insufficient access to education, and low wages. Additionally, these workers are often required to work long hours for low pay. This can lead to health problems, such as obesity and heart disease, and a decreased quality of life.

Due to the lack of available digital mediums, many of these workers have had difficulty finding work. This has led to increased levels of unemployment and poverty among blue collar workers in India. In order to address this problem, it is essential to invest in digital media.

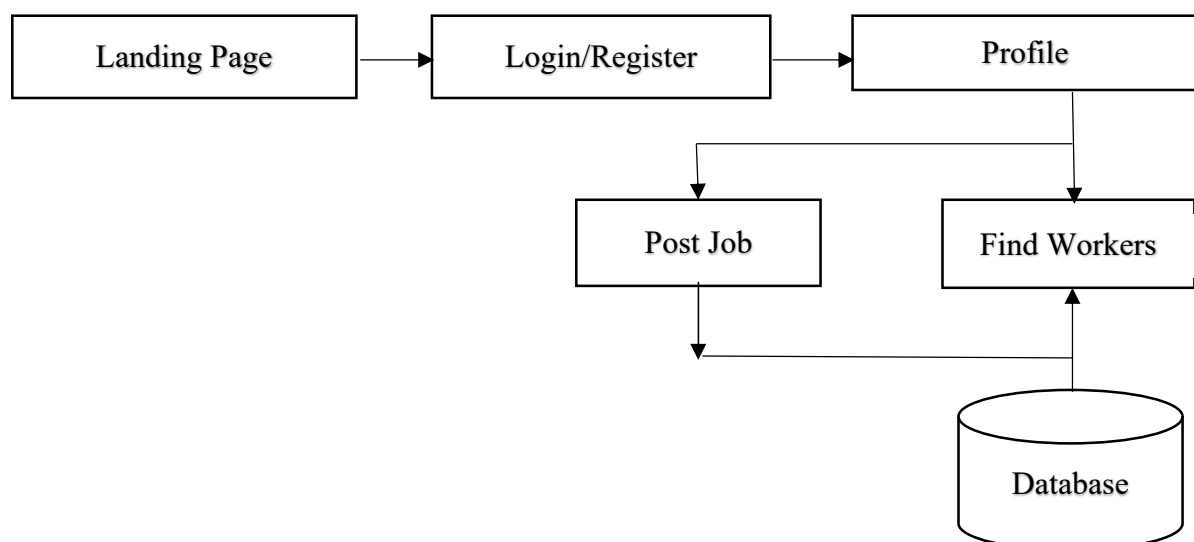

This platform will ensure that the employer and workers get in touch with minimal efforts. Further improvements can be done to verify both parties involved in the whole process.

Methodology

This web application will provide interface to register/login employer. They can register and login to their respective account and then can post or list job. Further, they can also search for the registered workers from database. This page will provide feature to filter the registered workers through city and type of work.

It features landing page, sign in page and registration page where a user is required to provide their contact information in order to hire worker. Once the user submits their contact information, an OTP will sent to the provided phone number. The user must enter the OTP to verify their contact information. Only then, the user will be considered as verified employer. For the workers there will be a separate registration interface from which the workers details can be fed into the database.

Application Flow Diagram

Technologies Used

This web application will incorporate latest technologies like React, Firebase and Cloud-based storage to make the process more efficient, effective, and convenient.

React.js

React is a declarative, efficient, and flexible JavaScript library for building user interfaces. ReactJS is an open-source, component-based front-end library responsible only for the view layer of the application. React is used to create modular user interfaces. It promotes the development of reusable UI components that display dynamic data.

A React application is made of multiple components, each responsible for rendering a small, reusable piece of HTML. Components can be nested within other components to allow complex applications to be built out of simple building blocks.

Firebase

Firebase is categorized as a NoSQL database program, which stores data in JSON-like documents. Firebase is a Backend-as-a-Service (BaaS) app development platform that provides hosted backend services such as a real-time database, cloud storage, authentication, crash reporting, machine learning, remote configuration, and hosting for your static files.

System Requirements

Software Requirement -

OS – Windows

IDE – Visual Studio Code

Language – HTML, CSS, JavaScript

Framework – React.js

Database – Firebase

Hardware Requirement -

Processor – Dual Core

Hard disk – 256 GB

Memory – 8 GB

Keyboard – any standard

Mouse – any standard

Monitor – any standard
